Intuitive design including trim

We've added high visibility piping of the contours for a sharper, cleaner look. The intuitive, high visibility markings make it easier to see important features, such as adjustments.

The 3M heated trim is approved for up to 30 washings. Breathable and pliable, the striped design helps reduce heat stress as it minimizes stored energy.

Yoke protection

Special hook and loop protection to minimize exposure to heat and fire.

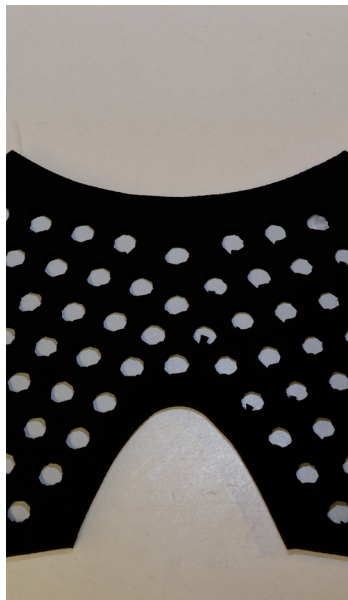

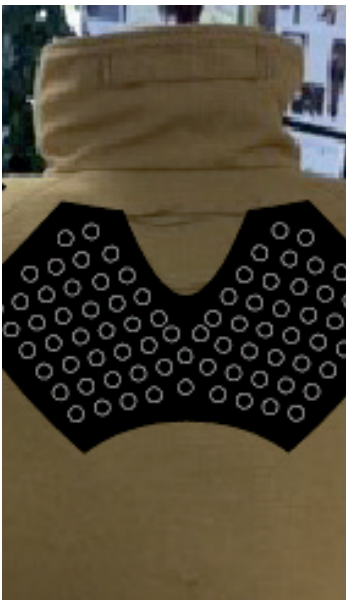

New hood attachment

To reduce bulkiness in the collar, we have redesigned the hood attachment. It's easy to add a hood, and when not in use, it's flatter for a more relaxed fit and not visible when a hood is not attached.

Shoulder protection

Extra reinforcements on the shoulders in DuPont™ Kevlar provide better durability and protect against wear and tear. The striped design on the back of the shoulders helps reduce stored heat for more comfort and flexibility.

New shoulder design

We are constantly looking for ways to reduce heat strain on the shoulder and neck area to improve comfort during extended wear. In the new design we have added a thermal layer that minimizes pressure and helps reduce the risk of heat transfer from SCBA's.

Ergonomic and adjustable collar

A new contoured design follows the jawline for a more ergonomic fit. We've added flexible closures on both sides of the collar to make it easier to frequently adjust the collar as depending on the situation.

Multi-configurable radio pocket

This pocket is fully adjustable in height and width using several velcro closures placed in the pocket. A simple strap closure is also an option.

Tablet pocket

As it has become more common for commanders and other personnel to carry tablets we have added an integrated, water-repellent tablet pocket. Here you can safely store a small or medium sized tablet in the jacket with easy access (not available for PRO sized tablets).

There are Velcro adjustments in the pockets to adjust the size and help keep the tablet stable. The option is available for all jacket lengths. High visibility markings make it easy to see the pocket closure.

Chip pocket

Tracking chips are practical for quickly identifying a suit with its service history. We have designed a small, closed transponder pocket for storing the tracking chip and making it easier to remove or replace it.

There are high visibility markings making it easy to see the pocket closure.
